

## **IST 479 / 679 – File Upload Lab**

You have already created an administrative page which allows you to manage articles on your blog. While creating a posting you will often find it helpful to include images or link to a PDF, MS Word or other document. To make these files available to your visitors, you will need to upload these files to your web server. The goal of this lab is to create a page which allows you to upload files to a given folder on your site.

I have created a sample page, called `admin_images.aspx`, which you can find in the same folder as these instructions on the LMS. Please download the code, read the comments to make sure you understand how the page functions and then test it on your blog.

Once the page is functioning correctly, you will need to modify it so that you can upload files to any folder on your site rather than just the “images” folder. You are welcome to collaborate with other students on this task.

**HINT:** Rather than setting up the “folderpath” as a global variable which is initialized on page load, you could pull this value from a drop-down which lists all the folders on your site.

**META HINT:** Use the “GetDirectories” method of the “DirectoryInfo” object to retrieve all the sub-folders within a folder.

If you complete the above task with time to spare, you can try to modify the page to allow you to add and delete sub-folders in addition to files.
